

Predicting Drug Shortages Before They Happen

A classification model that flags pharmaceutical products at elevated risk of supply shortage, engineered from manufacturer concentration, drug class, and supply chain signals — giving stakeholders lead time to act before disruption hits.

- PHARMACEUTICAL MANUFACTURERS
- HOSPITAL PHARMACY LEADERS
- HEALTHCARE SYSTEMS
- DISTRIBUTORS

SHORTAGE RISK WATCHLIST — TOP 10				primary driver shown
RANK	PRODUCT / CATEGORY	RISK SCORE		PRIMARY DRIVER
01	Epinephrine (Sterile Injectable)		92	Single-Source Mfr
02	Cisplatin (Oncology)		89	Sterile Injectable
03	Methylphenidate (ADHD Stimulant)		85	Regulatory Quota
04	Normal Saline (IV Fluids)		81	Demand Spike
05	Amoxicillin Suspension		77	Active Ingr. Scarcity
06	Bupivacaine (Local Anesthetic)		74	Single-Source Mfr
07	Fluorouracil (Chemotherapy)		70	Sterile Injectable
08	Sodium Bicarbonate Inj.		68	Regulatory Hold
09	Acyclovir IV		65	Active Ingr. Scarcity
10	Morphine Injectable		61	Regulatory Quota

SO WHAT

Single-source sterile injectables dominate the watchlist — the same vulnerability pattern behind past epinephrine and saline shortages, and the clearest target for dual-sourcing contracts.

01 — Proactive Inventory Planning

Build buffer stock before the listing hits

Early flags give manufacturers lead time to plan inventory before a shortage is public.

02 — Alternative Sourcing

Qualify backup suppliers ahead of disruption

Flags on single-source products point toward backup suppliers before the primary source fails.

03 — Continuity of Patient Access

Prioritize regulatory support where it matters

Agencies can target expedited inspections and import allowances at the highest-risk products.
